AWS S3 Event-Driven Automation Using AWS Lambda

Event-driven automation

Event-driven automation means that when an event happens, AWS automatically triggers an action without you manually starting it.

For example, when someone uploads a file to an S3 bucket, AWS Lambda can automatically run code to process that file.

AWS service

Amazon S3: Stores files such as CSVs, images, and documents.

S3 Event Notification: Announces that an event, such as an object upload, occurred.

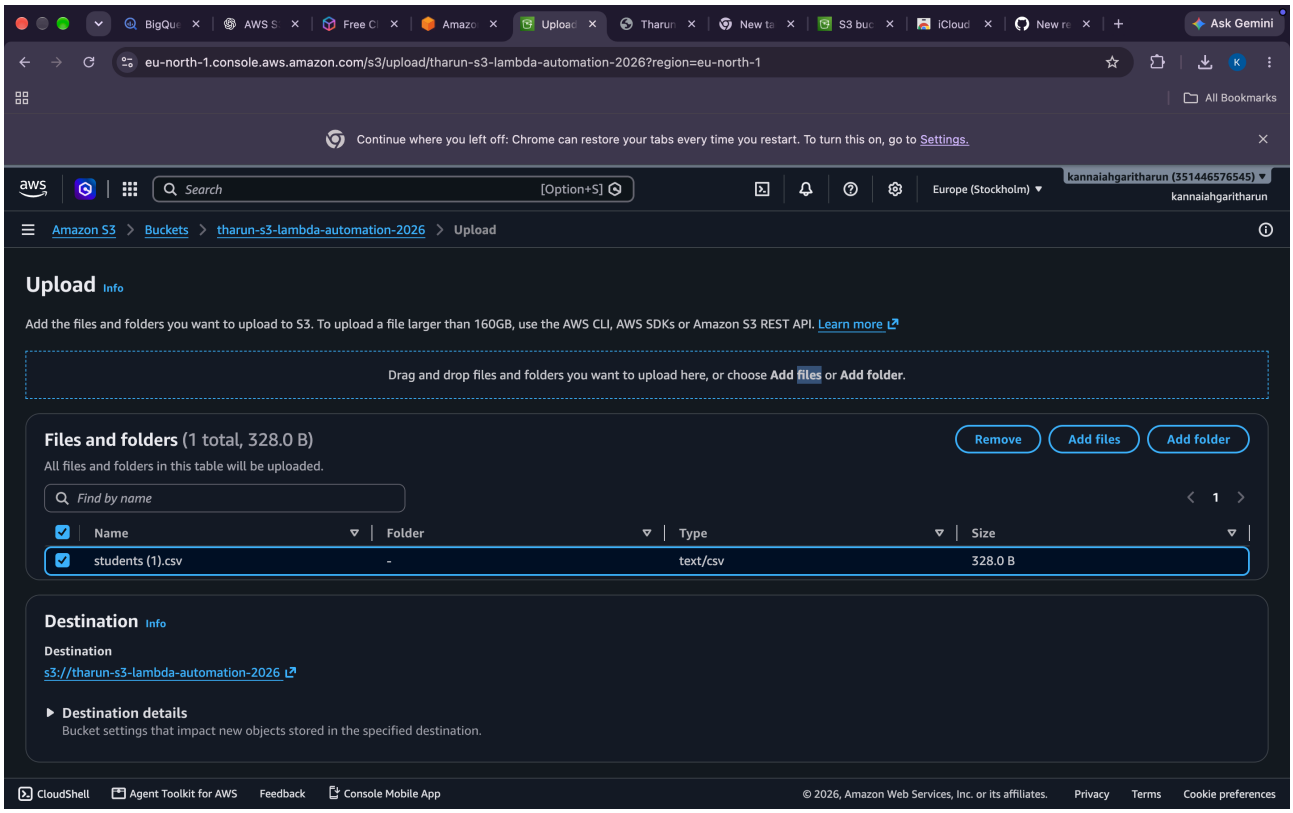

AWS Lambda: Runs your code in response to the event.

IAM role: Gives Lambda the permissions it needs, such as reading a file from S3.

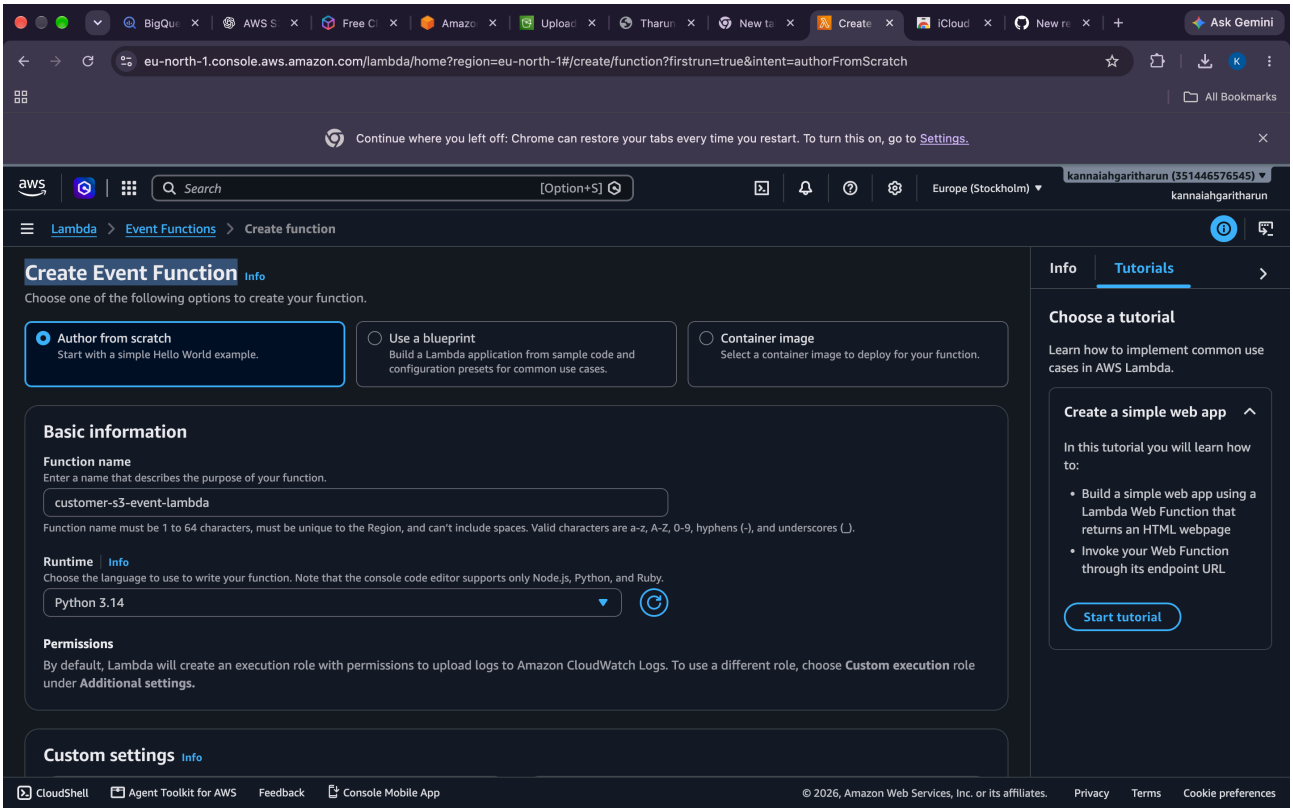

CloudWatch Logs: Helps you inspect Lambda execution logs and troubleshoot errors.

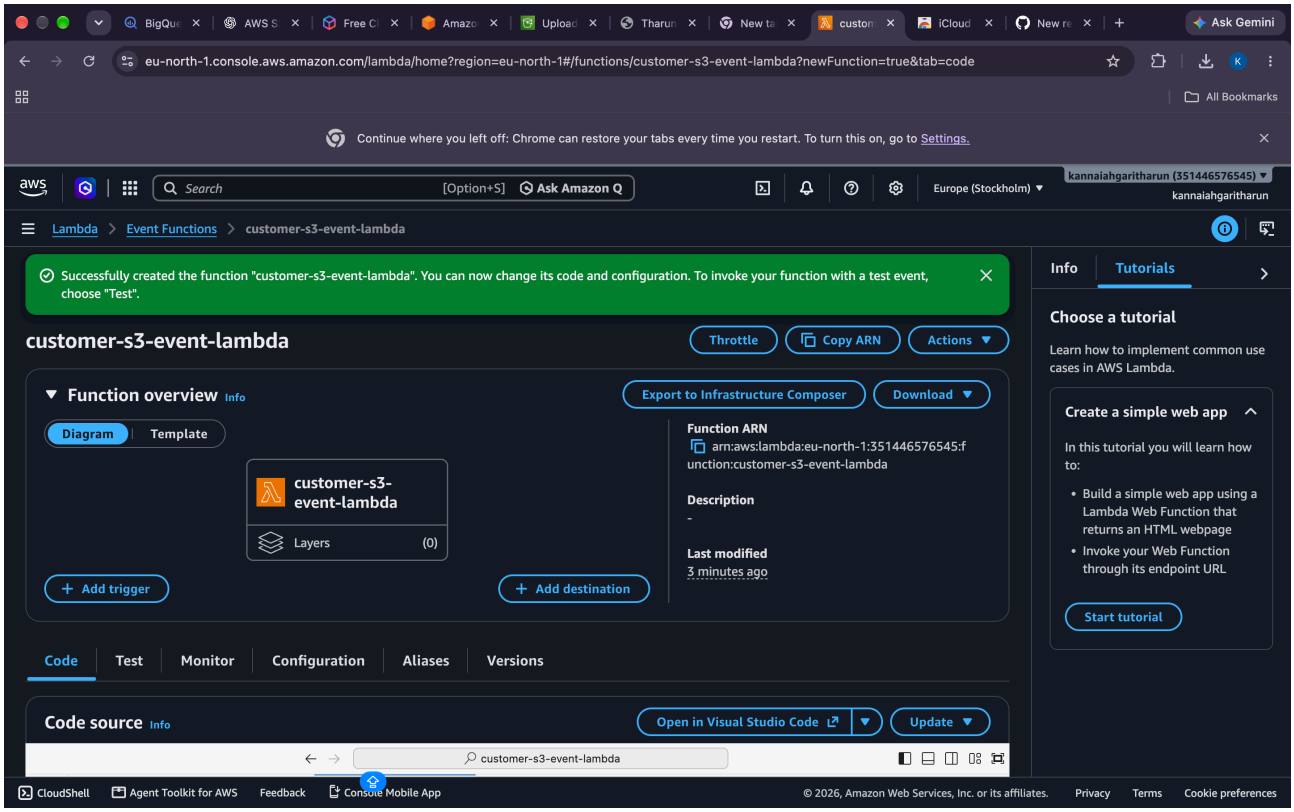

AWS documents this pattern as S3 invoking Lambda when an object is created; the function can then write details to CloudWatch Logs.

CREATED AND ADDED FILE IN S3 BUCKET

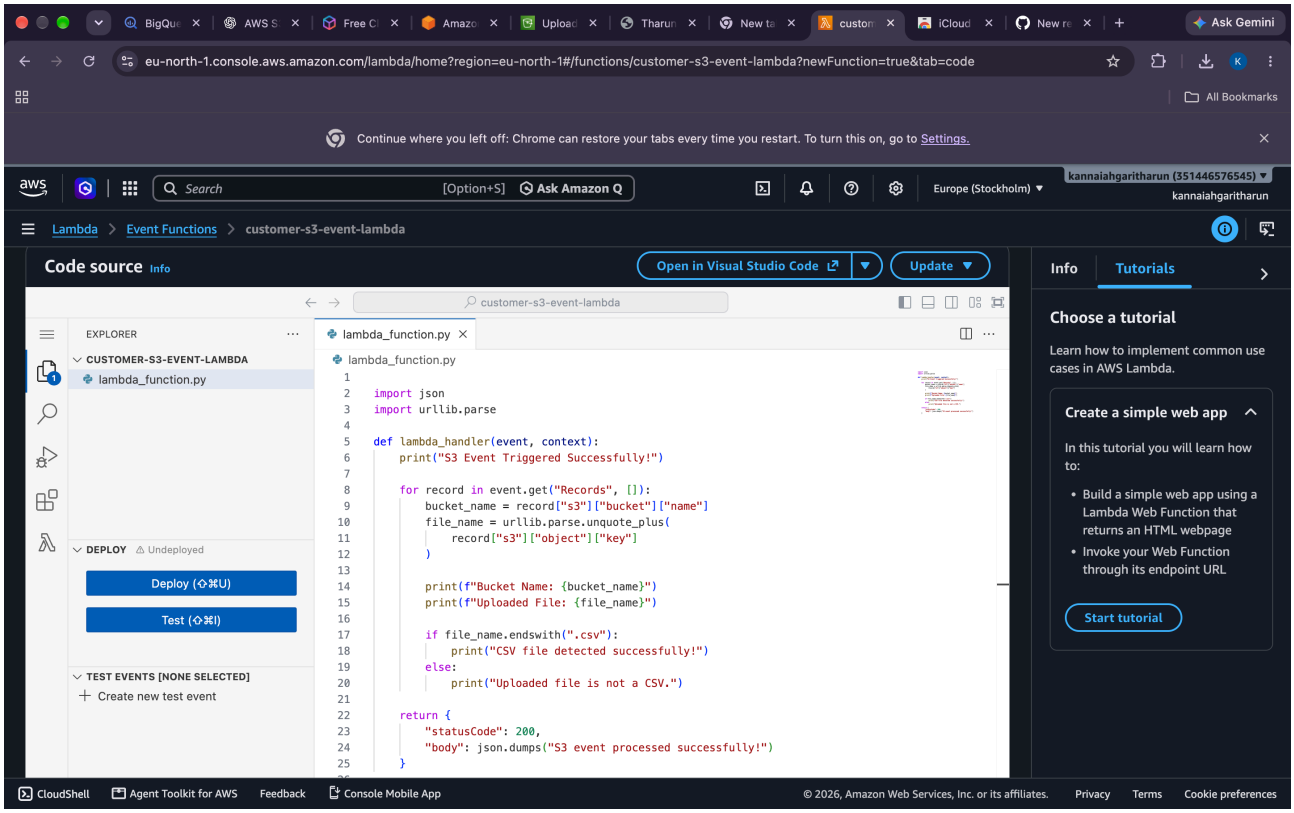

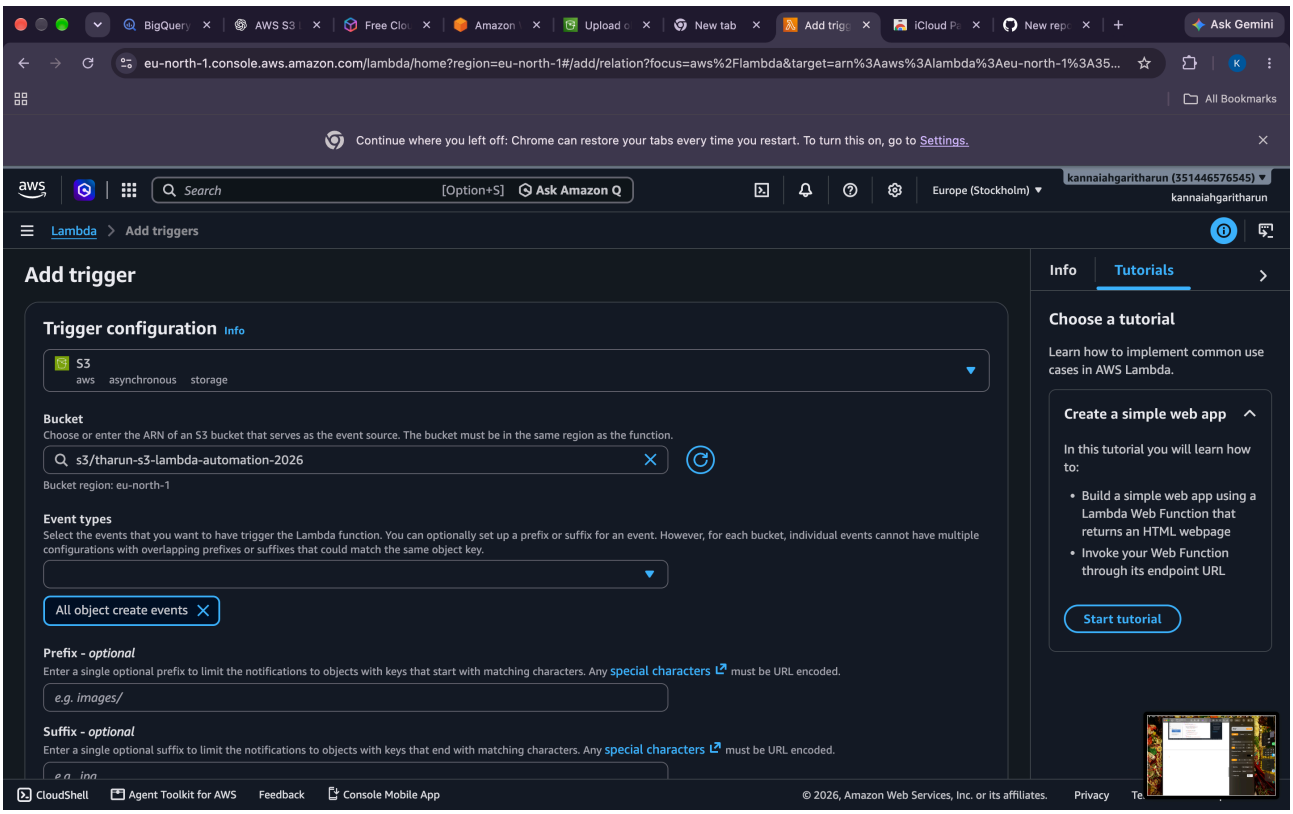

CREATING EVENT FUNCTION

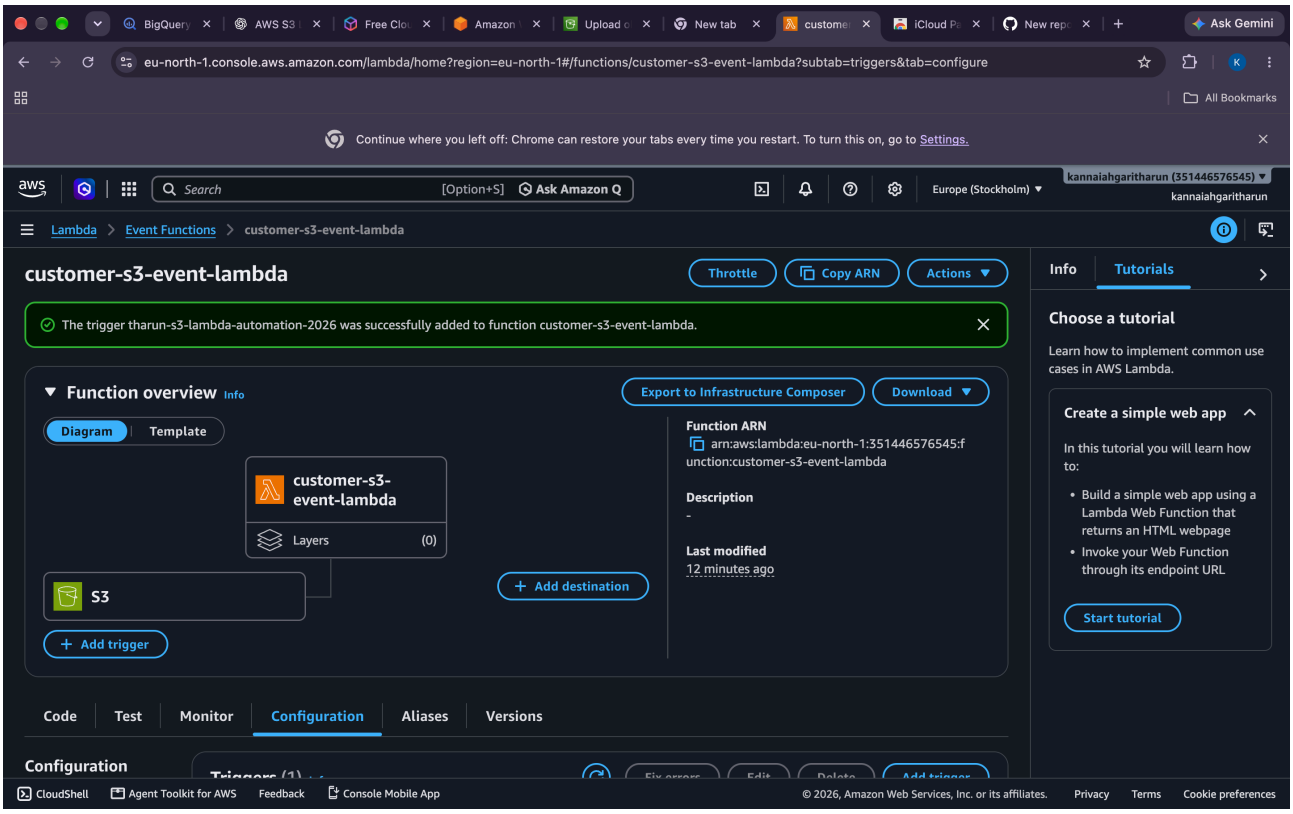

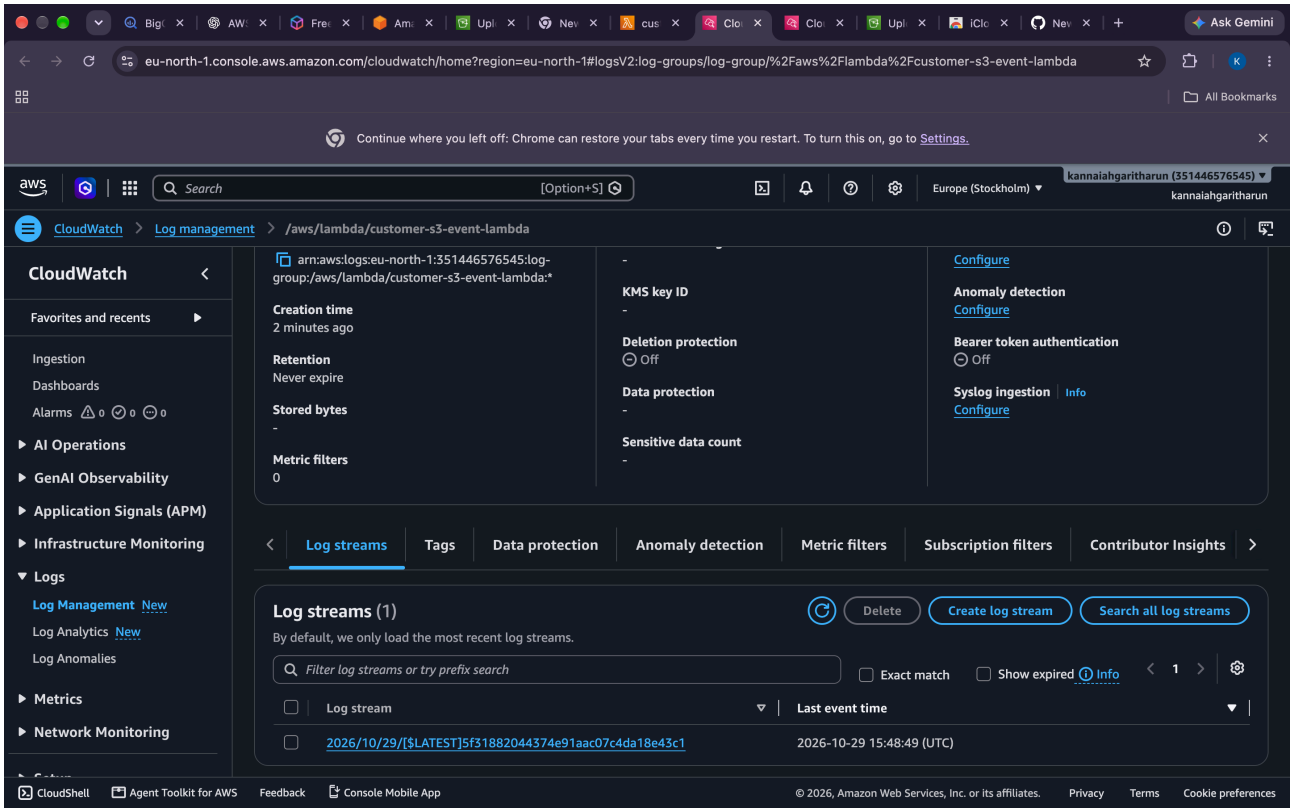

Add the Python code

eu-north-1.console.aws.amazon.com/lambda/home?region=eu-north-1#/add/relation?focus=aws%2Flambda&target=arn%3Aaws%3Alambda%3Aeu-north-1%3A35...
Continue where you left off: Chrome can restore your tabs every time you restart. To turn this on, go to Settings.

Lambda > Add triggers
Add trigger
Trigger configuration Info
S3
aws asynchronous storage
Bucket
Choose or enter the ARN of an S3 bucket that serves as the event source. The bucket must be in the same region as the function.
s3/tharun-s3-lambda-automation-2026
Bucket region: eu-north-1
Event types
Select the events that you want to have trigger the Lambda function. You can optionally set up a prefix or suffix for an event. However, for each bucket, individual events cannot have multiple configurations with overlapping prefixes or suffixes that could match the same object key.
All object create events
Prefix - optional
Enter a single optional prefix to limit the notifications to objects with keys that start with matching characters. Any special characters must be URL encoded.
e.g. images/
Suffix - optional
Enter a single optional suffix to limit the notifications to objects with keys that end with matching characters. Any special characters must be URL encoded.
